

**Two-Way Cast Iron Flanged PICV Control Valve
Adjustable Flow Limiter and Automatic Pressure Regulator
2-1/2 to 6" ANSI Class 125 or 250**

Description

Pressure Independent Control Valves integrate three functions into a single device: control valve, adjustable flow limiter and automatic differential pressure regulator. They are available in both ANSI Class 125 and 250.

Features

- Control valve with integrated differential pressure regulator and adjustable flow limiter
- ANSI 125 and ANSI 250 bodies and flanges
- 2-1/2-, 3-, 4-, 5-, and 6-inch (65, 80, 100, 125, and 150 mm)
- Field adjustable presetting
- ANSI Class IV leakage (0.01%)
- Pressure test (P/T) points
- Can be equipped with EN180, EN360, or ES247 electro-motoric actuators

Valve Body Flow Maximums

Table 1

Size	Maximum Flow Range GPM	ANSI Class 125	ANSI Class 250	ΔP Regulator Operating Range psi (kPa)

	140 to 860		PICV2-600(860)-250	9 to 90 (62 to 600)

- Application**
- For use in heating, ventilating and air conditioning systems as a control valve
 - For closed loop hot or chilled water applications

Caution Notations

CAUTION:		Equipment damage may occur if you do not perform a procedure as specified.

Mechanical Design

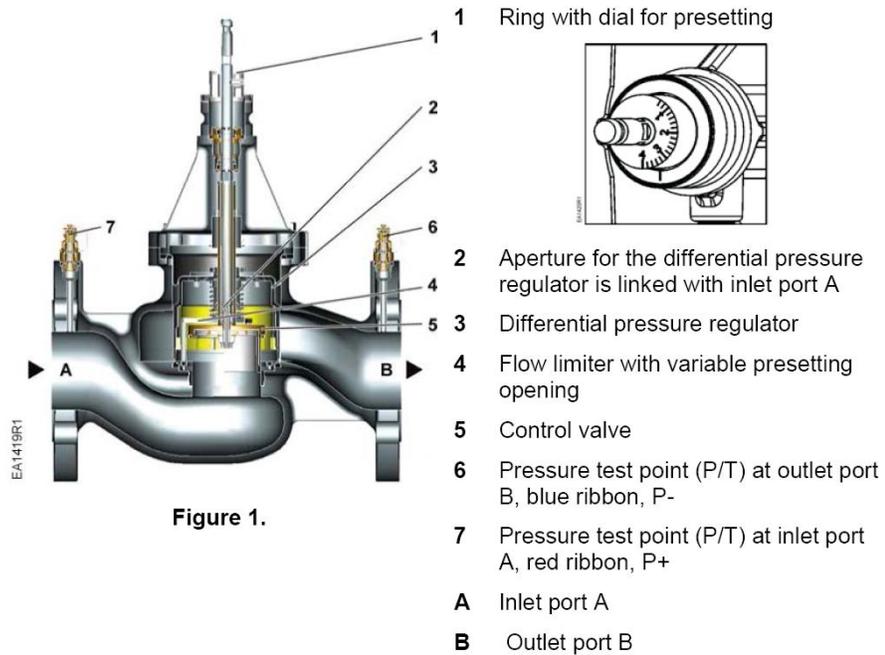

Figure 1.

Operation

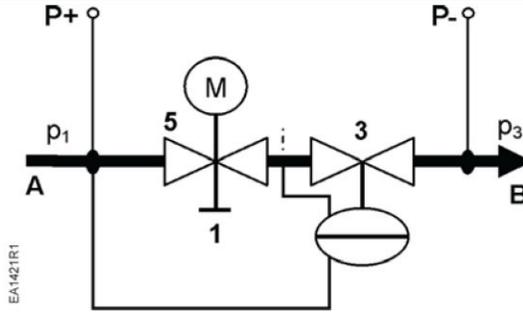

The Pressure Independent Control Valves combine three functions (see Figure 2):

- a control valve (5) for controlling the volumetric flow,
- a field-adjustable flow limiter (4) with a dial (1) for a pre-settable maximum volumetric flow,
- a differential pressure regulator (3) that automatically adjusts to pressure fluctuations in the hydraulic system respectively across the control valve to maintain a constant flow.

The mechanical series-connected differential pressure regulator keeps the differential pressure constant across the control valve, thus maintaining constant flow. The desired maximum volumetric flow can be preset with the field adjustable flow limiter. The building automation system controller (not shown) and the actuator regulate the volumetric flow and consequently the desired temperature in buildings, rooms or zones.

Operation,
continued

- A Inlet medium (inlet port A)
- B Outlet medium (outlet port B)
- 1 Flow limiter with dial for presetting
- 3 Differential pressure regulator
- 5 Control valve with mounted actuator
- P- P/T port, pressure test point with blue ribbon (6)
- P+ P/T port, pressure test point with red ribbon (7)
- p₁ Pressure at inlet port A of PICV Valve
- p₃ Pressure at outlet port B of PICV Valve

Figure 2. Pressure Independent Control Valve Operation.

Medium Flow

The medium entering the Pressure Independent Control Valve (inlet port A) first passes through the variable presetting opening (4) which is connected to the ring with a dial (1) for presetting the desired maximum volumetric flow. The actuator (not shown here) opens and accurately positions the control valve. Then, the medium flows through control valve (5) with a linear characteristic.

Before leaving the Pressure Independent Control Valve (outlet port B), the medium passes through a built-in mechanical differential pressure regulator (3). This differential pressure regulator is the heart of the Pressure Independent Control Valve and ensures that the selected volumetric flow is maintained across the whole working range and independent of the inlet pressure p₁.

Pressure Test Points

The Pressure Independent Control Valve is equipped with two pressure test points (P+, P-) for measuring and monitoring the differential pressure across the valve during commissioning.

Manual Control

Manual control is only possible with a mounted actuator.

Advantages

The advantages of Pressure Independent Control Valves are:

- Once the flow limiter is set to design flow, the hydronic circuit self balances, even when changes to the system are made, such as additions.
- For any heat demand the Pressure Independent Control Valve with mounted actuator can be set to the desired volumetric flow and will remain constant regardless of pressure fluctuations in the system.

Constant flow regardless of pressure changes in the system leads to a more stable control, less wasted energy and greater comfort.

**Volumetric Flow/
Dial Presetting**

Tables to determine the dial setting for a desired volumetric flow.

Engineering Notes

CAUTION:

Install the valve so that the flow of the medium matches the direction of the arrow on the valve body. Failure to do so may damage the differential pressure regulator.

Recommendations

- A strainer or dirt trap should be fitted upstream of the valve to enhance reliability and service life.
- Remove dirt, welding beads, and so on from valves and pipes.
- Do not insulate the actuator bracket; air circulation must be ensured.

Mounting Notes

Pressure Independent Control Valves and actuators can be easily assembled on site. Neither special tools nor adjustments, besides the presetting, are required. Prior to mounting the actuator, the required volumetric flow must be set. Each valve is supplied with a bib tag indicating the maximum GPM flow for each setting of the flow limiter.

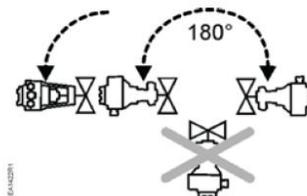

Figure 3. Accepted Mounting Positions.

ØD1 = Raised area of flange

H = Total actuator height plus minimum distance to the wall or the ceiling for mounting, connection, operation, maintenance, etc.

H1 = Dimension from the pipe center to install the actuator (upper edge)

H2 = Valve in the «Open» position means that the valve stem is fully extended

Warranty

Application-related technical data are guaranteed only when the valves are used in connection with our recommended actuators.

Warranty is void, if used with non-recommended actuators.
